Acousmos

AI-powered dictation for Mac with fast voice-to-text, AI clean-up, and a private searchable archive saved locally on your Mac.

About

Acousmos is an AI-powered dictation app for Mac that turns speech into text in any app, adds AI clean-up, and keeps a private searchable archive on your Mac. It is built for people who want fast voice-to-text without switching windows, copying text around, or losing the original wording of what they said. The app supports a hotkey-driven workflow, works with macOS 14+ on Apple Silicon, and includes a free one-month Pro trial with no signup or card required.

What is Acousmos

Acousmos is an AI-powered dictation app for Mac that lets you speak naturally and have

on-the-fly cleanup, and a local archive of every transcription. Instead of treating dictation as a disposable input method, Acousmos keeps a private record on your Mac so you can search past speech later.

The product is positioned as “voice for Mac” and is meant to run alongside everyday tools like editors, browsers, Slack, Notes, Gmail, and chat apps. Acousmos supports Apple Silicon and macOS 14+, and the site presents it as privacy-first transcription with local storage for the archive. That makes it a strong fit for people who want an AI-powered dictation app that is useful both in the moment and as a long-term memory system.

Key features

Acousmos combines live dictation with a local archive, so the app is more than a simple voice-to-text tool.

- **Fast, accurate voice-to-text**: The app is built to keep up with natural speech and to transcribe quickly.
- **Works in any Mac app**: One hotkey can be used across the system, so you do not need to open a separate window.
- **AI clean-up while you speak**: You can remove filler, correct grammar, or reformat the result as you dictate.
- **Custom dictionary support**: Names, jargon, and symbols can be taught once and reused.
- **Private searchable archive**: Every transcription is stored on your Mac and can be searched later.
- **Open format and export**: The archive is presented as exportable, with no lock-in implied by the site.
- **Language options**: The product page lists auto language support for English, Español, Français, Deutsch, Italiano, Português, [illegible], [illegible], and [illegible].
- **Plan-based volume and privacy options**: The site says full accuracy is included on every plan, while paid plans add more volume and, on Pro, BYOK and local model options.

For people comparing an AI-powered dictation app with standard speech input,

How to use it

Acousmos is built around a simple three-step workflow that relies on a hotkey.

1. **Press the hotkey** in any app on macOS. The site shows the workflow working in editors, browsers, Slack, Notes, and similar tools.
2. **Speak naturally**. The product explicitly welcomes ums and repeats, and the demo copy says a 60-second session can be captured without storing audio.
3. **Let the text appear**. Acousmos inserts the cleaned-up transcription at the cursor, then saves the original to the archive.

If you want the AI-powered dictation app to do more than raw transcription, you can use its cleanup features while speaking. If you need a recurring term or code symbol to be recognized correctly, add it to the custom dictionary so the app can reuse it later.

For new users, the free trial is straightforward: install the app, dictate once, and the one-month Pro trial begins without signup or a credit card. The site says the trial includes every feature and 20,000 managed-cloud words.

Who it is for

Acousmos is a good fit for Mac users who write or think out loud all day and want an AI-powered dictation app that stays out of the way.

- **Developers and technical users** who need code symbols, jargon, and names handled consistently.
- **Writers and editors** who want speech-to-text plus cleanup for drafts, notes, and emails.
- **Founders and operators** who capture meeting ideas, plans, and decisions verbally.
- **People who value privacy** and want a local archive instead of a cloud-only transcript library.
- **Users who live in multiple apps** and want dictation that follows the cursor rather than forcing a dedicated editor.

Acousmos also suits people who like the idea of a personal voice archive. The product frames this as a searchable “second brain” for spoken thoughts, which is especially useful if you dictate ideas, brainstorming sessions, or quick reminders throughout the

What to know before you use it

There are a few important limits to understand before choosing Acousmos as your AI-powered dictation app.

- **Mac only, with hardware and OS requirements**: The site lists Apple Silicon and macOS 14+.
- **Accuracy is not tied to price**: The product says every plan gets full accuracy, so pricing is about volume and privacy controls, not a higher-quality engine.
- **The archive is local, but transcription may not be**: On the trial and Plus plan, audio is transcribed through the company's managed cloud; Pro can use your own provider keys or fully local models.
- **Pro privacy features are not a discount tier**: The site describes BYOK and local models as a privacy/control upgrade, not a cheaper option.
- **The archive is not a substitute for official records**: Because it is a personal transcription history, you should still use official source documents for contracts, legal text, medical details, or compliance-critical notes.
- **Transcription still needs review**: Even with fast voice-to-text and cleanup, names, niche jargon, and context-heavy statements can still need a quick check before you send them.

In short, Acousmos is an AI-powered dictation app for Mac for people who want speed now and a searchable local archive later. If you need system-wide voice-to-text with cleanup, local storage, and privacy-aware options, it is worth trying during the free month and judging how well the archive fits your workflow.
